

MULTI-FLUID APPLICATOR

ABSTRACT

A multi-fluid applicator with one or more fluids sealed separately within it with opening means enclosed within the applicator to allow the commingling and releasing of the fluids enclosed within the applicator is disclosed. The enclosed opening means may be operated by either squeezing or bending the applicator at or near the enclosed opening means. Once the enclosed opening means is opened, the fluids sealed within the elongated sealed container will commingle with each other and be released for application or may be released directly for application. There are no loose parts that may be lost and the fluids are completely sealed within the applicator.
